THE OPERATING SYSTEM FOR MUSICAL INDEPENDENCE

Built in Detroit.

Local founder briefing · V4

Independent artists are already businesses.

The work around the music does not disappear because an artist is independent.

**Rights. Publishing. Distribution. Finance.
Marketing. Social. Licensing. Publicity. Road.
Merchandise. Creative operations.
Administration.**

Historically, doing that work at a professional level required an organization around the artist. Independence changed who controls the career. It did not remove the operational load.

**The artist should own the career without
having to become every department in the
company.**

Build the organization into the software.

indii.music is an artist-controlled operating system for the business behind the music.

It coordinates specialized AI, business departments, documents, metadata, cloud services, local computer execution, external platforms, and the artist's own working environment.

The goal is not to give the artist another dashboard to manage.

**The goal is to let the artist ask for an outcome
- and give the system the infrastructure to
carry the work through.**

A career is not a release. It is a loop.

indii.music is designed around the full operating cycle - not a single transaction at one point in it.

Distribution is part of the operating system.

indii.music includes a custom DDEX release-delivery engine. The working code generates and validates DDEX ERN release messages, builds release packages from audio, artwork and metadata, performs pre-delivery checks, and supports secure SFTP package delivery from the desktop environment.

The current implementation supports ERN 4.3 and 3.8, ISRC and UPC management, release quality-control checks, distribution status tracking, and DDEX sales-report reconciliation into the finance layer.

DDEX is the rail. indii.music is everything built around the rail.

That distinction matters. A standalone distribution tool can move a release. indii.music can connect distribution to the rights, metadata, assets, finance, marketing, documents and operating history already surrounding the artist.

The value is in what knows what.

An AI assistant can generate text. A distribution service can deliver files. A merch service can print shirts. A finance tool can categorize transactions.

indii.music's advantage is the connective layer: those capabilities can operate from a shared understanding of the artist, the release, the assets, the rights, the business records and the work already completed.

**CREATE → PREPARE → REGISTER →
DELIVER → RELEASE → TRACK → OPERATE
→ REPEAT**

Each cycle creates context for the next one. The system becomes more useful because the artist does not restart the business from zero every time a song is released.

The system works. Now it is being exercised.

indii.music is in active end-to-end validation and hardening ahead of commercial launch.

Realistic artist-business operations are run through the working platform while the coding-agent team observes execution. When a workflow exposes a failure, integration issue, or edge case, it is diagnosed, corrected, and run again.

Testing includes representative business artifacts - receipts, documents and other records a working artist would actually upload and expect the system to ingest and use.

This is launch validation of a functioning platform, not development of a hypothetical MVP.

The operating environment can travel with the artist.

indii.music's remote architecture connects the mobile Controller to the Studio computer so work can continue when the artist is away from the machine that holds the local tools, files and capabilities needed to execute it.

That matters for a working artist: on the road, at a show, in a studio, or simply away from home, the business does not stop because the desktop is somewhere else.

**Phone → Studio → indii.music execution layer
→ local and cloud capabilities.**

An artist should be able to sell one shirt without owning one shirt.

A new artist with a small audience can sell through connected print-on-demand fulfillment without buying speculative inventory first.

For touring artists, the same operating layer can support stock awareness and replenishment: identify what is running low, determine what is needed next, and coordinate fulfillment to the next destination.

The infrastructure also creates room for limited drops and show-specific merchandise - including a product purchased at the merch table and finalized from something unique that happened at that night's show.

A software business with multiple ways to enter.

The primary commercial model can support a free entry point and paid levels that expand capability, automation, usage and included AI/API resources.

Founder Edition provides a separate premium early-access software path for customers who want deeper access and a closer relationship with the platform during launch.

Customer revenue does two jobs: it funds operation without dilution and proves that the market will pay for the system.

For qualifying business purchasers, software costs may receive business-expense treatment depending on the purchaser's circumstances. Buyers should consult their tax professional.

Capital takes a working platform through the commercial finish line.

The founder has financed indii.music through the build and into active validation. The next capital supports final integration and hardening, AI/API and cloud costs, production infrastructure, legal and business operations, initial customer acquisition, and operating runway through commercialization.

The money is not being raised to discover whether indii.music can be built.

The next milestone is paying customers operating their businesses through the production system.

Built in Detroit for the work behind the music.

Detroit gives indii.music an unusual starting position: globally significant music culture, deep independent DNA, working artists who understand the operational problem immediately, and a broader business community capable of understanding the technology opportunity without needing to work in music.

Local participation can mean early customers, capital, operating expertise, introductions, strategic relationships or credibility.

Music is the first vertical. The larger thesis is that AI can give independent creative businesses operational capabilities that once required organizations around them.

indiiOS is Layer One.

Once the artist has a persistent operating layer, separate connected businesses become possible around direct commerce, fan relationships, limited physical and digital artifacts, provenance, persistent collections and other forms of artist-to-fan value.

Those are future systems with their own architectures. They are not being presented as features that exist today.

The important point is that the operating layer creates the infrastructure from which those businesses can be built.

There is more than one useful way into indii.music.

USE IT. Put the platform into real artist-business operation as an early customer.

BACK IT. Participate in the capital required to carry the operating platform through launch and early commercial growth.

OPEN A DOOR. Make an introduction to someone who should see the product - locally or inside technology, creator, commerce or music.

The next step is to see the software.

SEE indii.music.
